Executive summary

Background

The Housing and Health Partnership between the Department of Family and Community Services (FACS) – South Western Sydney Area, NSW Land and Housing Corporation (LAHC), Population Health, South Western Sydney Local Health District (SWSLHD), NSW Health and the Centre for Health Equity Training Research and Evaluation (CHETRE) has developed an implementation plan for 2018-2021. Objective One of the Housing and Health Partnership Agreement is: To facilitate the integration of actions to improve the social and health and well-being outcomes of South West Sydney residents affected by housing relocation and renewal. This document brings together previous work related to the Housing and Health Partnership and suggests future directions for new work.

Methods

From January to June 2018, a document review, interviews with RT staff and brief literature reviews were undertaken. From this a process map and program logic for the current work of the RT process was created, as well as options for future work.

Findings

Document Review

Internet and organisational file searches yielded a high number of relevant documents, most of which were created by or within partnership between CHETRE, SWSLHD, NSW Housing or local councils. Documents ranged from meeting minutes to conference abstract proposals and formal reports of evaluation work. A number of Health Impact Assessments (HIAs) have provided insight into how different redevelopment stages might affect community health, and literature reviews have been conducted ranging in topics from developing a model intervention for social housing transition to place-based interventions in locationally disadvantaged communities.

Process of Relocation

With the input of different teams at FACS, a process map ([Figure 2](#)) was created which indicates seven milestones in the relocation process:

- redevelopment stage determination,
- client notification,
- relocation interview,
- relocation statement,
- housing offer,
- relocation,
- and follow ups.

Details regarding the actors involved at the various milestones as well as a simplified outline of the contextual factors to consider are included in a second process map that more completely describes the process (Figure 3). Facilitating factors described by staff were described across non-partnering organisations/community/policy level, organisational level and staff personal knowledge and attributes (Table 2).

Program Logic for Relocation

A program logic was created to encompass the entirety of the relocation process from the perspective of the RT. This program logic outlines the essential elements of the relocation process (Figure 5).

Potential for Future Work

Evaluating the Relocation Process

An evaluation of the relocation process would inform understanding if the program is meeting its goals as outlined in the program logic, as well as identifying critical points within the process for supporting health and wellbeing and barriers and enablers to a successful outcome. An evaluation would allow for evidence to be created that could be used to support current work, as well as identifying how best to support the relocation team to enable positive client outcomes (for example, through tools and resources). Evaluation would require first establishing evaluation goals and identifying resourcing requirements. The evaluation could be co-designed with the HHP groups to allow for broader input into the design.

Referral Pathways for Relocation Clients Requiring Health Services

It has been reported by the relocation team that occasionally during the relocation process the case managers identify that clients have unmet medical needs. Delays in linking clients to the appropriate referral service has been identified as potentially harmful for the clients and relocation process, as well as generating extra work for the RT who may not be adequately resourced to create referrals. This solution consists of creating a resource for the RT that provides information and contacts for various SWSLHD, private and NGO services that are available to refer clients to would help in reducing this burden.

Conclusions

Much of the work within the HHP partnerships so far has been foundational in nature, setting up HHP to take on more in-depth evaluation and monitoring work. Moving forwards, a formal evaluation of the Relocation Process could demonstrate the ways in which the relocation process is impacting on health and wellbeing (and to what extent and for whom), and also provide feedback on areas that could be strengthened. Another identified need was creating additional resources for the relocation team staff to facilitate improved connection of the clients with health and other services. Both of these projects will allow for development of the health and housing work in regard to relocation processes.

Background

The Housing and Health Partnership between the Department of Family and Community Services (FACS) – South Western Sydney Area, NSW Land and Housing Corporation (LAHC), Population Health, South Western Sydney Local Health District (SWSLHD), NSW Health and the Centre for Health Equity Training Research and Evaluation (CHETRE) has developed an implementation plan for 2018-2021. The Housing and Health Partnership Agreement 2018-2021 Implementation Plan considers three main objectives, with established working groups progressing meeting each of these goals.

This project falls under Objective One of the Housing and Health Partnership Agreement 2018-2021 Implementation Plan: To facilitate the integration of actions to improve the social and health and well-being outcomes of South West Sydney residents affected by housing relocation and renewal.

Aims

The Health and Housing Partnership (HHP) Objective One Working Group has identified a need to understand and document how the **relocation support process** affects tenants' and their families' health and to identify recommendations for:

1. Maximising potential positive health impacts and minimising negative impacts
2. Data collection and processes that would enable monitoring and evaluation of the impact of relocation process on tenants.

The Communities Plus Relocation Team (RT) identified as an important potential outcome of evaluating the relocation support process would be documenting and validating good practice that currently is not being captured by normal reporting processes. This project distinguishes impacts of the relocation process from urban renewal (physical regeneration) and community renewal (addressing locational disadvantage within community) (see Figure 1).

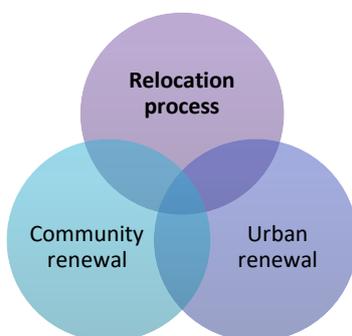

Figure 1 Types of relocation related areas of impact

Purpose of this document

This document is intended as a commencement point for future Objective 1 Work Group activities as well as HHP more broadly. The intent of this work is to identify and collate previous HHP work in relation to relocation, map the relocation process and identify potential points for intervention to support health and health equity and well as identifying potential future projects.

Methods

From January to June 2018, CHETRE engaged in a mixed methods approach to:

1. Determine what work had been completed within the HHP in regard to HHP Objective 1 up to this date.
2. Utilising information collected through documents reviews, stakeholder engagement and literature reviewing, a process map and program logic for the current work of the RT process was created.
3. Through discussion with the HHP Objective 1 working group and the RT staff, priority projects for future work were identified and future works developed.

Process	Action	Participants
Document Review	Scan of documents in CHETRE files, Population Health files, and SWSLHD website. HHP members requested to identify relevant documents. Documents were reviewed to identify further project reports or proposals Documents were reviewed, and relevant articles included in a catalogue.	HHP
Stakeholder input	Meetings Informal focus groups Validation workshops	Communities Plus Relocation Team Objective 1 workgroup
Brief Supplementary Literature Review	Review relevant literature to identify health implications of relocation [abridged/truncated literature review conducted by hand searches of terms in Scopus --"relocation" AND "housing" AND "evaluation" AND ("impact" OR "process")]	CHETRE

Findings

Document Review

Internet and organisational file searches yielded in over 500 documents related to HHP dating back 12 years. Documents ranged from meeting minutes to conference abstract proposals and formal reports of evaluation work. Some of this work was produced by SWSLHD or FACS, however other documents are from external entities such as universities or non-governmental organisations (NGO's). Table 1 summarises the different documents produced by SWSLHD or FACS that were directly related to Relocation collated, organised in reverse chronological order. Table 2 summarises documents from external entities. For the full table with links to each document embedded, password protected [website](#) page.

2011	Airds Bradbury Social Sustainability and Health Impact Assessment	Heather Nesbitt Planning and Community Dimensions Pty Lt for Landcom	Report
2009	Airds Bradbury Baseline Community Survey	Sweeney Research for Housing NSW	Other

The documents identified included a number of Health Impact Assessments (HIAs) that have provided insight into how different redevelopment stages might affect community health, and literature reviews have been conducted ranging in topics from developing a model intervention for social housing transition to place-based interventions in locationally disadvantaged communities. Most of these documents, reports and proposals have been directly linked to SWS or one of its individual suburbs or housing estates. By and large, the documents discuss or inform best practices and planning, but do not actually evaluate relocation. In addition, meeting records and reports suggest that the HHP has considered developing more ambitious, resource-intensive projects (e.g. longitudinal studies of relocation impacts) however these have not progressed beyond initial planning stages.

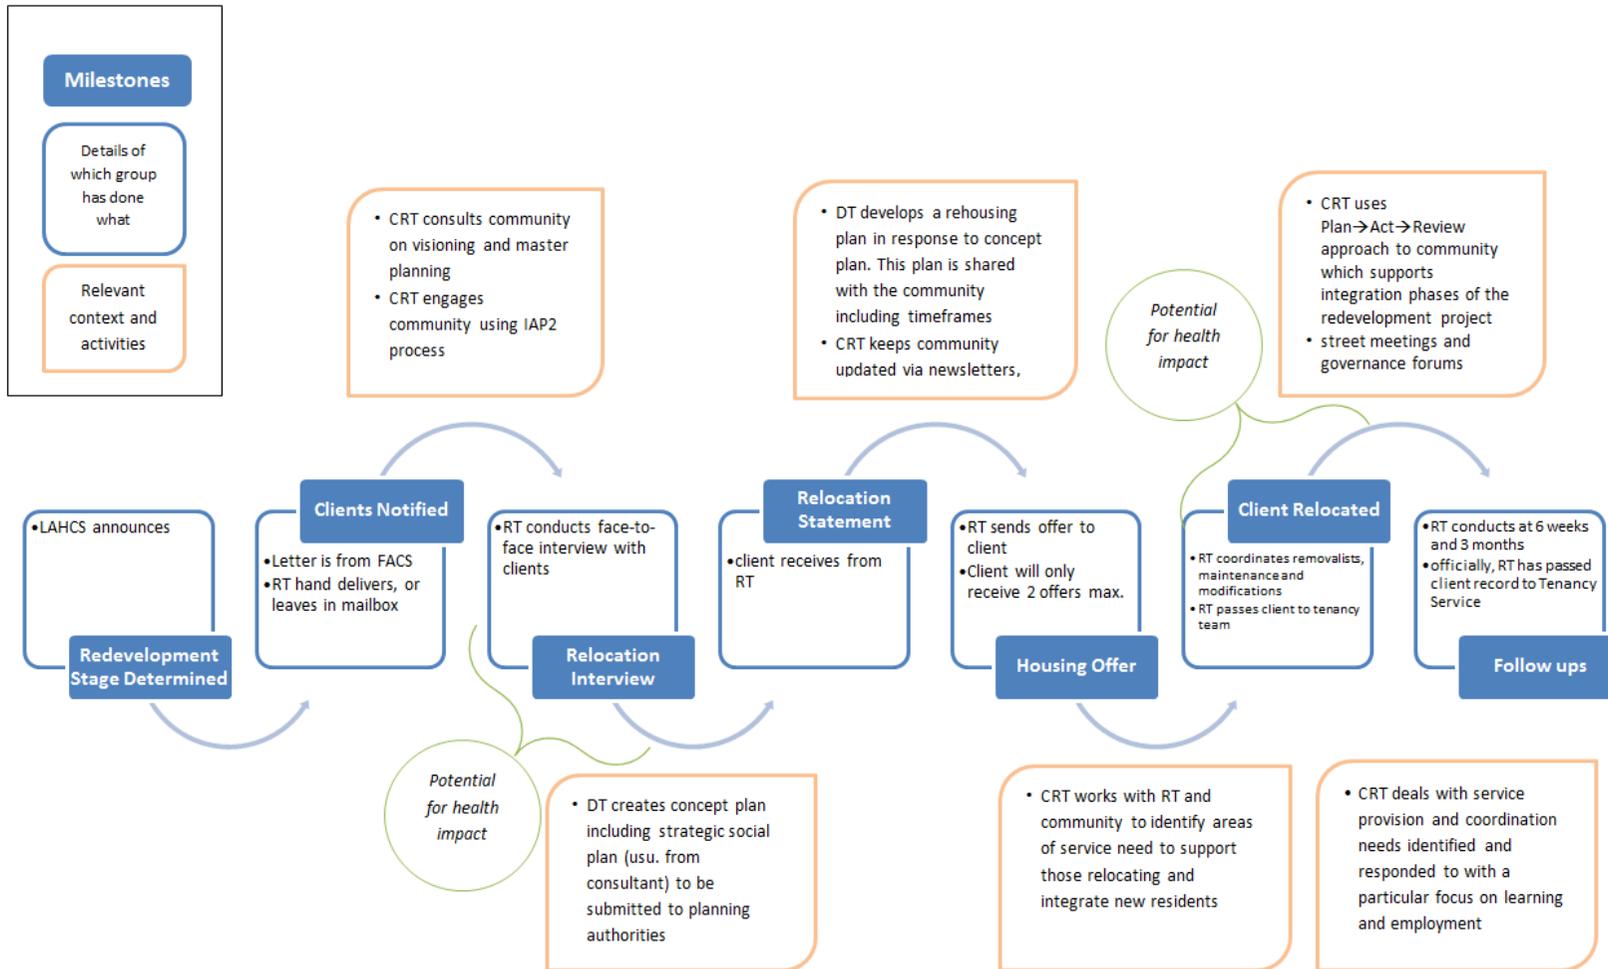

Process Map of Relocation

With the input of different teams at FACS, a process map (Figure 2) was created which indicates seven milestones in the relocation process: redevelopment stage determination, client notification, relocation interview, relocation statement, housing offer, relocation, and follow ups. Details regarding the actors involved at the various milestones as well as a simplified outline of the broader contextual factors to consider are included in a second process map that more completely describes the process (Figure 2, see page over).

Figure 2 Simplified Process Map for Relocation Milestones

Figure 3 Process Map of Relocation Milestones

Facilitating Factors

In addition to the process of relocation, facilitating factors of a successful relocation were identified by RT staff. These factors were identified as key to enabling successful relocations - successful relocations are contingent on these factors being in place. These factors are listed in Table 2. Future work could involve asking other stakeholders (such as clients) to identify facilitating and hindering factors as well as evaluating the role of these factors in relocation case studies. Understanding and documenting the role of these factors in the relocation process could provide valuable evidence and support for the RT.

Table 2 Facilitating Factors for Successful Client Relocation

<i>Staff personal knowledge and attributes:</i>
<ul style="list-style-type: none"> • Highly-skilled, experienced staff • On-going communication with client <ul style="list-style-type: none"> ○ Enables building of trust and rich knowledge- also provides a process to, in some cases, change clients' thinking • Close relationship with clients, characterised by mutual respect <ul style="list-style-type: none"> ○ Allows for caseworkers to explain rationale for decisions- expectation management and trust building • Up-to-date knowledge/ awareness of groups and organisations to which they can refer clients
<i>Organisational (FACS):</i>
<ul style="list-style-type: none"> • Manageable caseloads for RT • Clear process, but allowing for flexibility in information that can be gathered, considered, and acted upon • Process allows for some negotiation with clients (e.g. install blinds, garden sheds etc.) • Interviews held at client's property – relaxed, unthreatening atmosphere • Ability to gather new data is limited by workload/capacity to deal with extra data enabled through tablets • RT has good relationship with those dealing with upcoming properties, can be made aware of properties that will be available in near future-
<i>Broader context</i>
<ul style="list-style-type: none"> • Available housing stock • Linking to doctors for accurate medical assessments

Actors

An important consideration in the process map is that there are number of potential actors that are missing. Depending on the individual relocation, a variety of different organisations and entities can become involved throughout the relocation. Some of these organisations may include (but are not limited to) legal advocates, healthcare workers or organisations, National Disability Insurance

Scheme, and other community-based organisations. Their role in the relocation process can be facilitating or hindering, depending on the unique circumstances and clients. An example of this provided by the RT team was that the RT may have already conducted a face-to-face interview to understand a client’s needs, it has been finalised and a physician has given certification of any medical conditions, but an advocacy group with which is supporting the client may dispute all or part of the resulting relocation statement.

Further, a large piece of the relocation process is when RT coordinators make referrals to clients in their new communities. These referrals are to organisations that can meet clients’ identified needs. At virtually any time in the process, an outside entity can affect the relocation process (either positively or negatively). Because of the myriad of ways and points in which these effects can take place, those outside entities are not included in this process map.

Creating pathways

The way and processes through which housing is allocated during the relocation process has implications for tenants self-perceived health and wellbeing (Arthurson, Levin, and Zierch, 2016). Mapping the range of pathways associated with the relocation process is beyond the scope of this stage of the project but could be incorporated into future evaluation work. As an example of how a pathway can work, a discrete pathway of the interview process was created (Figure 4).

This pathway suggests that in the short term, a successful interview will increase client confidence that they will be appropriately housed, as well as their feeling of autonomy. A successful interview (in effect, the first personal interaction the client is having with the bureaucratic system) might also have the effect of putting clients at ease with the entire process and working with government officials. At the same time, a successful interview will also increase the RT Case Manager’s confidence in their ability to house the client well and provide information that enables successful relocation planning and decision making. This in turn leads to improved mental wellbeing outcomes for clients (and also potentially RT case managers) as well as increasing the chances of successful relocation. From this simplified process, it can be seen that evaluation of the program could be through an evaluation of the outputs (number of interviews) or through measure short or longer-term outcomes of interviews (confidence levels of clients and staff, cooperation in the process, number of clients appropriately housed). Further elaboration of the pathway would also integrate facilitating factors demonstrating how these factors enable (or act as barriers) to the pathways.

Figure 4 Example of relocation interview pathway

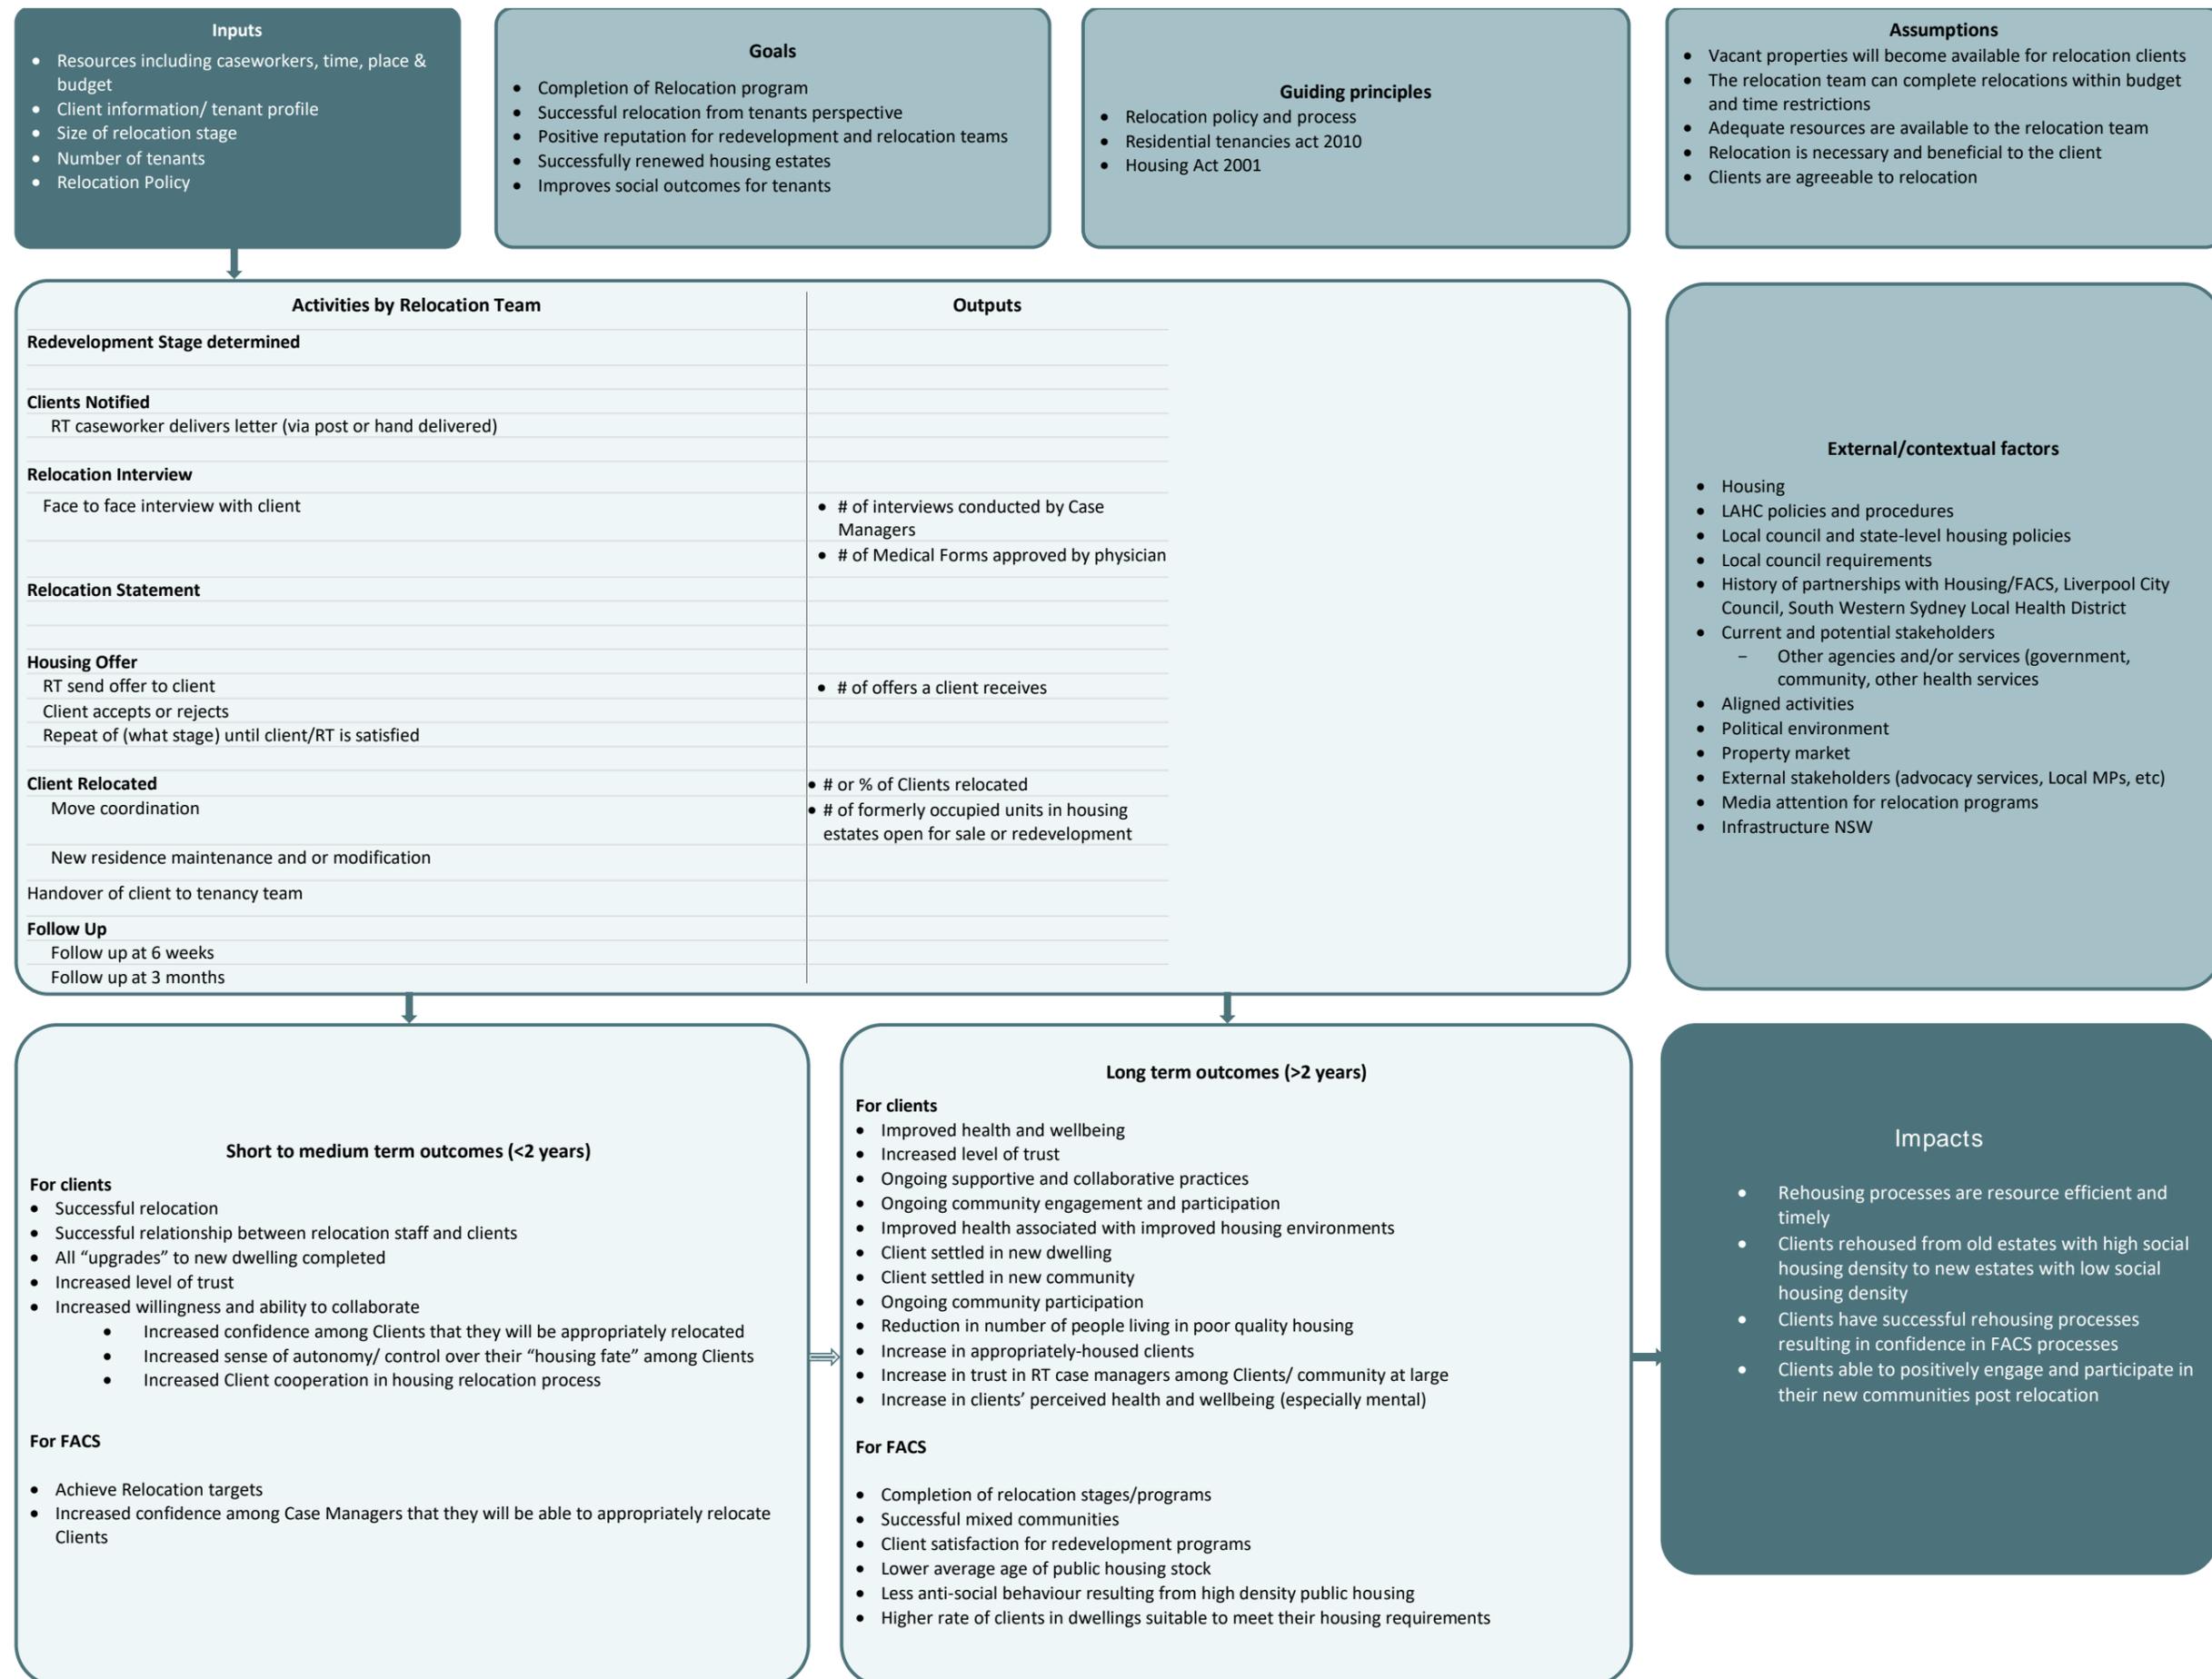

<ul style="list-style-type: none"> • 1 Case Manager (RT) • 1 Client (and family) 	<ul style="list-style-type: none"> • Increased confidence among Clients that they will be appropriately relocated • Increased sense of autonomy/ control over their “housing fate” among Clients • Case manager has increased knowledge of client needs • Increased confidence among Case Managers that they will be able to appropriately relocate Clients • Client has increased knowledge of relocation process 	<ul style="list-style-type: none"> • Positive productive relationship developed between client and housing services • Increased Client cooperation in housing relocation process • Case managers have appropriate level of understanding of client needs • 	<ul style="list-style-type: none"> • Reduction in number of people living in poor quality housing • Increase in appropriately-housed Clients • Increase in trust in RT case managers among Clients/ community at large • Increase in clients’ perceived health and wellbeing (especially mental)

Outputs ↗			
<ul style="list-style-type: none"> • # of interviews conducted by Case Managers 			
<p>Key (contingent) facilitating factors</p> <ul style="list-style-type: none"> • Highly skilled experienced staff • Flexibility in interview content • Interviews held at client’s location 			
<p>Contextual Factors:</p> <ul style="list-style-type: none"> • Local council and state-level housing policies • LAHC policies and procedures 			
<p>Assumptions:</p> <ul style="list-style-type: none"> • Clients are being relocated into housing of equal or better quality housing than their original situation 			

Program Logic

Program logic models are a way of representing the resources, processes, outcomes and contexts of a program, allowing for a visual representation of the relationships between these elements. A program logic model can be used for program planning but is also used in program evaluation. A larger program logic was created with the assistance of RT for the entire relocation process from the perspective of the team (Figure 5). This outlines the whole process and identifies contextual considerations. This program logic could be used to begin identifying an evaluation framework for the program.

Figure 5 Program logic for the Housing Relocation Process

Potential Future Works

Recommendations for potential future work to strengthen health within the relocation process stemmed from two major needs identified by stakeholders in the HHP Objective 1 working group.

There are;

1. A need to evaluate the relocation process to better understand the critical points and barriers and enablers,
2. Difficulties experienced by the relocation team in referring clients to health services.

Suggested for future work in both areas have been elaborated on below.

Evaluating the Relocation Process

Components	Explanation
<p>Rationale and Aims</p>	<p>An evaluation would create evidence that could be used to support current work, identify areas to strengthen or support the relocation team and enhance health and wellbeing outcomes for clients. It has been identified by the RT that they currently have insufficient evidence to demonstrate that their work is effective in successfully relocating clients. The evaluation of the relocation process would demonstrate whether the program is meeting its goals as outlined in the program logic, identify critical points within the process and barriers and enablers to a successful outcome and equity related impacts.</p>
<p>Process/ Approach</p>	<p>The evaluation process suggested in the working group meetings included completing an evaluation of the process by following a number of clients through their relocation process and/or conducting an audit of a number of completed relocations that were deemed successful or unsuccessful by the RT team. Following a variety of relocations would enable investigation of the presence or absence of the enabling factors identified in the relocation mapping process. Both of these processes would likely require a mix of observational, interviewing and document audit to gain a more comprehensive understanding of the process.</p>

Components	Explanation
	<p>The evaluation would first require the development of clear goals for and identification of resourcing. The program logic can be used to guide the creation of the evaluation questions as it shows the expected goals, stages and outcomes of the relocation process. The evaluation should be co-designed with the HHP groups to allow for broader input into the design.</p> <p>It is recommended that the evaluation include both process and impact evaluations. Process evaluations may be formative, and answer “Was our process appropriate?”, or summative “Did we do what we set out to do?”</p> <p>Impact or outcome evaluations aim to answer the questions, “Did we create an impact on the participants or outputs?” “ how did the relocation process work for whom and in what circumstance?”e</p>
<p>Expected outcomes</p>	<p>These are dependent on the type of evaluation to be completed but could include;</p> <ul style="list-style-type: none"> • Create evidence whether the program is meeting its goals, • Improved understanding of the process and critical areas, barriers and facilitators in the process, • Identification of equity related impacts, • Understand how to improve the process if required.
<p>Further considerations</p>	<ul style="list-style-type: none"> • Set clear goals for why the evaluation is required and what the evaluation will be used for. • Consider where resourcing for the evaluation work will come from, as the process will likely be outside the resource allocations of the HHP.

Referral Pathways for Relocation Clients Requiring Health Services

Components	Explanation
<p>Rationale and Aims</p>	<p>It has been reported by the relocation team that during the relocation process the case managers sometimes identify that clients have unmet medical needs. Currently, it is stated by the team leaders that case managers have insufficient health training and awareness of the health system to suggest where an appropriate referral platform is for these clients. This is outside the scope of case manager’s role to provide health related support to these clients.</p> <p>It has been suggested that a solution could be creating a resource for the RT that provides information and contacts for various SWSLHD, private and NGO services that are available to refer clients to..</p>
<p>Process/ Approach</p>	<p>In order to understand what resources are required and useful to case managers and clients it is necessary to first collect evidence from previous cases about the types of gaps that exist in staff knowledge and capacity, as well as the health issues identified in working with clients where gaps exist. This could be completed through discussions with staff about the health issues they have come across and surveying them to understanding their knowledge.</p> <p>Once the gaps are identified, health and housing staff can collaborate to determine the appropriate resources required for staff and clients. Ideas that have been suggested include;</p> <ul style="list-style-type: none"> • Providing staff a repository of services available, • Creating targeted kits for clients, • Adding health and referral information in introductory packs for clients.
<p>Expected outcomes</p>	<p>Expected outcomes include;</p> <ul style="list-style-type: none"> • Understanding of the challenges faced by case workers and clients in regards to unmet health and referral needs

Components	Explanation
	<ul style="list-style-type: none"> • Creation of referral or information resources to meet these needs.
Further considerations	<ul style="list-style-type: none"> • Set clear goals for the outcomes of this piece of work. • Understand what resources will be required to conduct the evaluation and create the resources. • Will need to consider how resources will be kept up to date. • Consider evaluating the usefulness of the resources once they are implemented to ensure they are successful.

Conclusions

As evidenced by the document audit, HHP has a long history of rigorous work connecting two distinct government entities with overlapping mandates and goals. Much of the work has been foundational in nature, setting up HHP to take on more complicated and in-depth evaluation and monitoring work. Moving forwards, it would be beneficial to carry out an evaluation of the Relocation Process, including opportunity for feedback on the process itself for clients. The relocation process is interacting with some of the neediest populations in SWS. An evaluation would afford HHP partners the opportunity to demonstrate the ways in which the relocation process is succeeding (and to what extent and for whom), and also provide feedback on areas that could be improved through the partnership.

Future steps could include using the program logic to develop a multi-level evaluation which considers not only individual perceptions of relocation and self-reported health and wellbeing, but which also seeks to factor in the systems that influence health in the relocation process, and by what process this might occur. Other steps could be developing resources and pathways for the RT to provide their clients resources and pathways for better management of their existing or developing health conditions.
